

## Meeting Minutes 2/23/21

We had to use 2 different people between the emotive device and ours for testing last Thursday.

The tests that were conducted were the 4-7-8 breathing model followed by drawing 5 lines, 5 squares, 5 triangles, and 5 circles.

The breathing test seemed to be the best for comparison across devices.

We now have the new prototype PCB. The parts for this new circuit were ordered last Friday.

The final draft of the PCB will be ordered through EZEDE.

We invited Dr. Kumar to snapshot 3 next week.

The reviews of our ERR from last week were mostly positive.

Testing for this week will most likely be simple math problems and the 4-7-8- model.
